

Your gateway to efficient international trade

Enables corporates to execute, manage and report on international trade transactions, and digitize letters of credit, guarantees and collections.

Finastra Trade Portal helps banks meet customer needs by providing enhanced service, driving business growth through value-added offerings, and ensuring a quick time-to-market. Additionally, it reduces operational risk and offers greater transparency.

Trade finance today is a mix of paper-based and siloed digital processes that hinder seamless end-to-end management. Banks need a flexible, scalable operating model to support both existing and emerging trade finance products. Additionally, banks require a modular technology stack for embedded banking and componentized solutions that integrate easily with their legacy systems.

**Navigating the future:
Regulatory changes, client experience,
business expansion, profitability,
and sustainability in Trade Finance.**

Changing regulatory landscape

There is a growing commitment to and consensus around adopting global standards in trade finance, led by the International Chamber of Commerce and the United Nations Commission on International Trade Law (UNCITRAL).

Key initiatives include the Electronic Uniform Customs & Practice for Documentary Credits (eUCP) v. 2.0, the Electronic Uniform Rules for Collections (eURC) v. 1.0, the Model Law on Electronic Transferable Records (MLETR), and the Uniform Rules for Digital Trade Transactions (URDTT).

Enhancing user experience

Half of the banks report that retaining and winning clients has become more challenging. They consider enhancing the client user experience as the top priority for their corporate digital engagement platform.¹

Potential to expand business

Banks are looking to grow their business through digitization by expanding the range of products and services offered to the corporate customer via self-service portals.

Improve margins

In the face of market competition and shrinking profit margins, businesses are compelled to automate and upgrade their value chains to enhance productivity and profitability.

Sustainability considerations

28.5 billion paper trade documents are printed and flown around the world daily. The World Economic Forum (WEF) has found that digitizing trade documents could potentially reduce global carbon emissions from logistics by as much as 12%.

Approximately, 80% of the world's carbon emissions are estimated to originate from global supply chains. To achieve net zero outcomes, these supply chains will need to undergo significant decarbonization.²
